# Why is $f_{\text{esc}}$ Important?

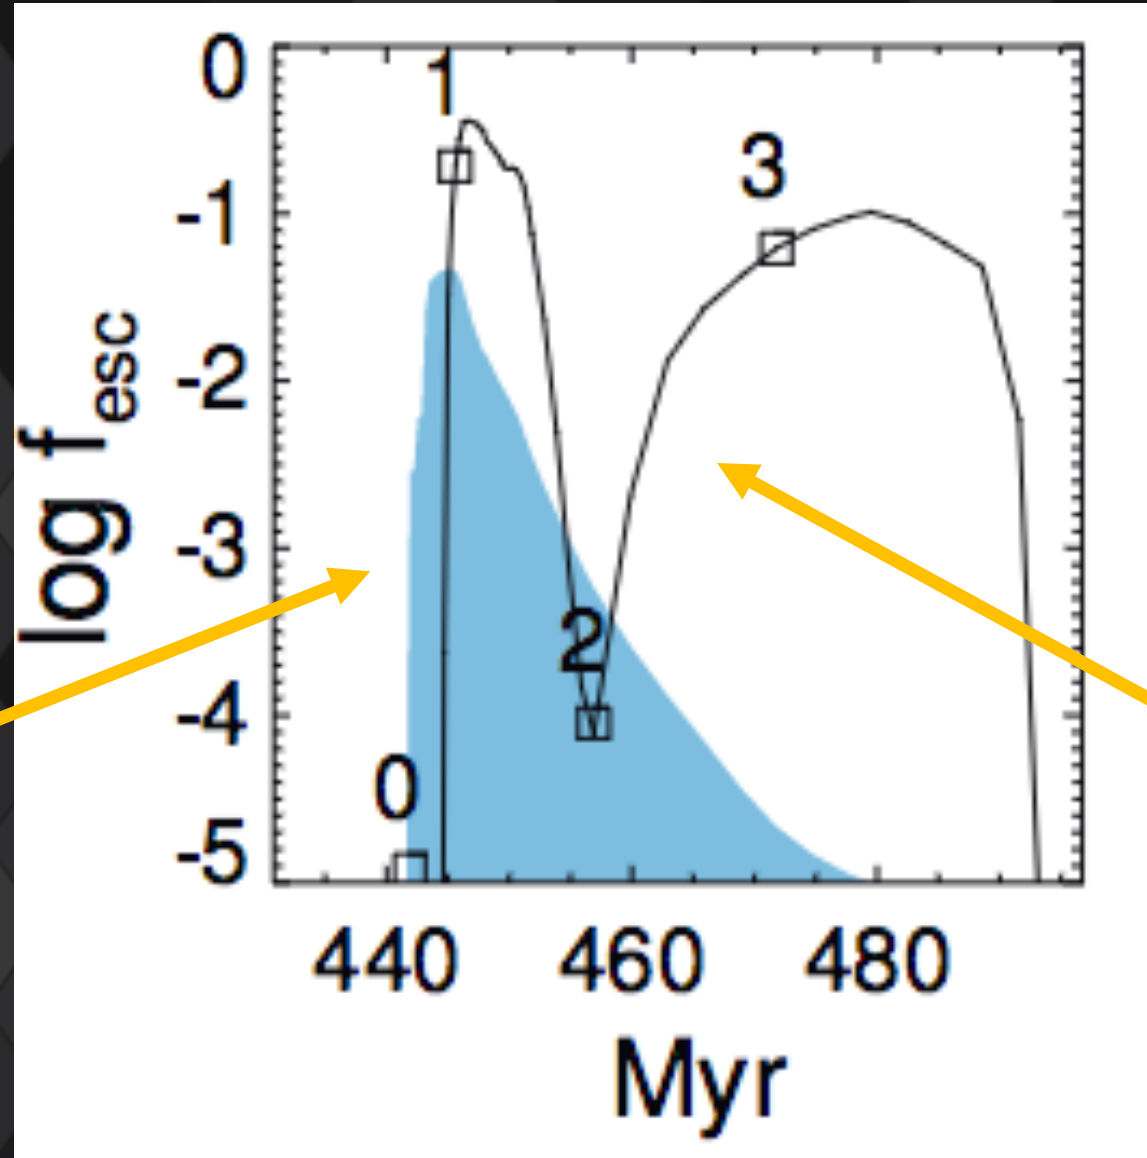

$$f_{\text{esc}} = \text{Constant}$$

$$f_{\text{esc}} \propto \text{Mass}^{-1}$$

The form of  $f_{\text{esc}}$  can drastically affect the topology and duration of reionization.

# $f_{\text{esc}}$ Depends On Galaxy Processes

Radiation  
Feedback

SN Blowout

# My Question

How does implementing a **physically motivated**  $f_{\text{esc}}$  affect the evolution of ionized hydrogen? How does this interplay affect galaxy properties?

- How does the topology of reionization change?
- How does the duration change?

# Semi-Analytic Models

- Describes the flow of baryons within a galaxy.

Hot gas cools : Move gas from hot to cold.

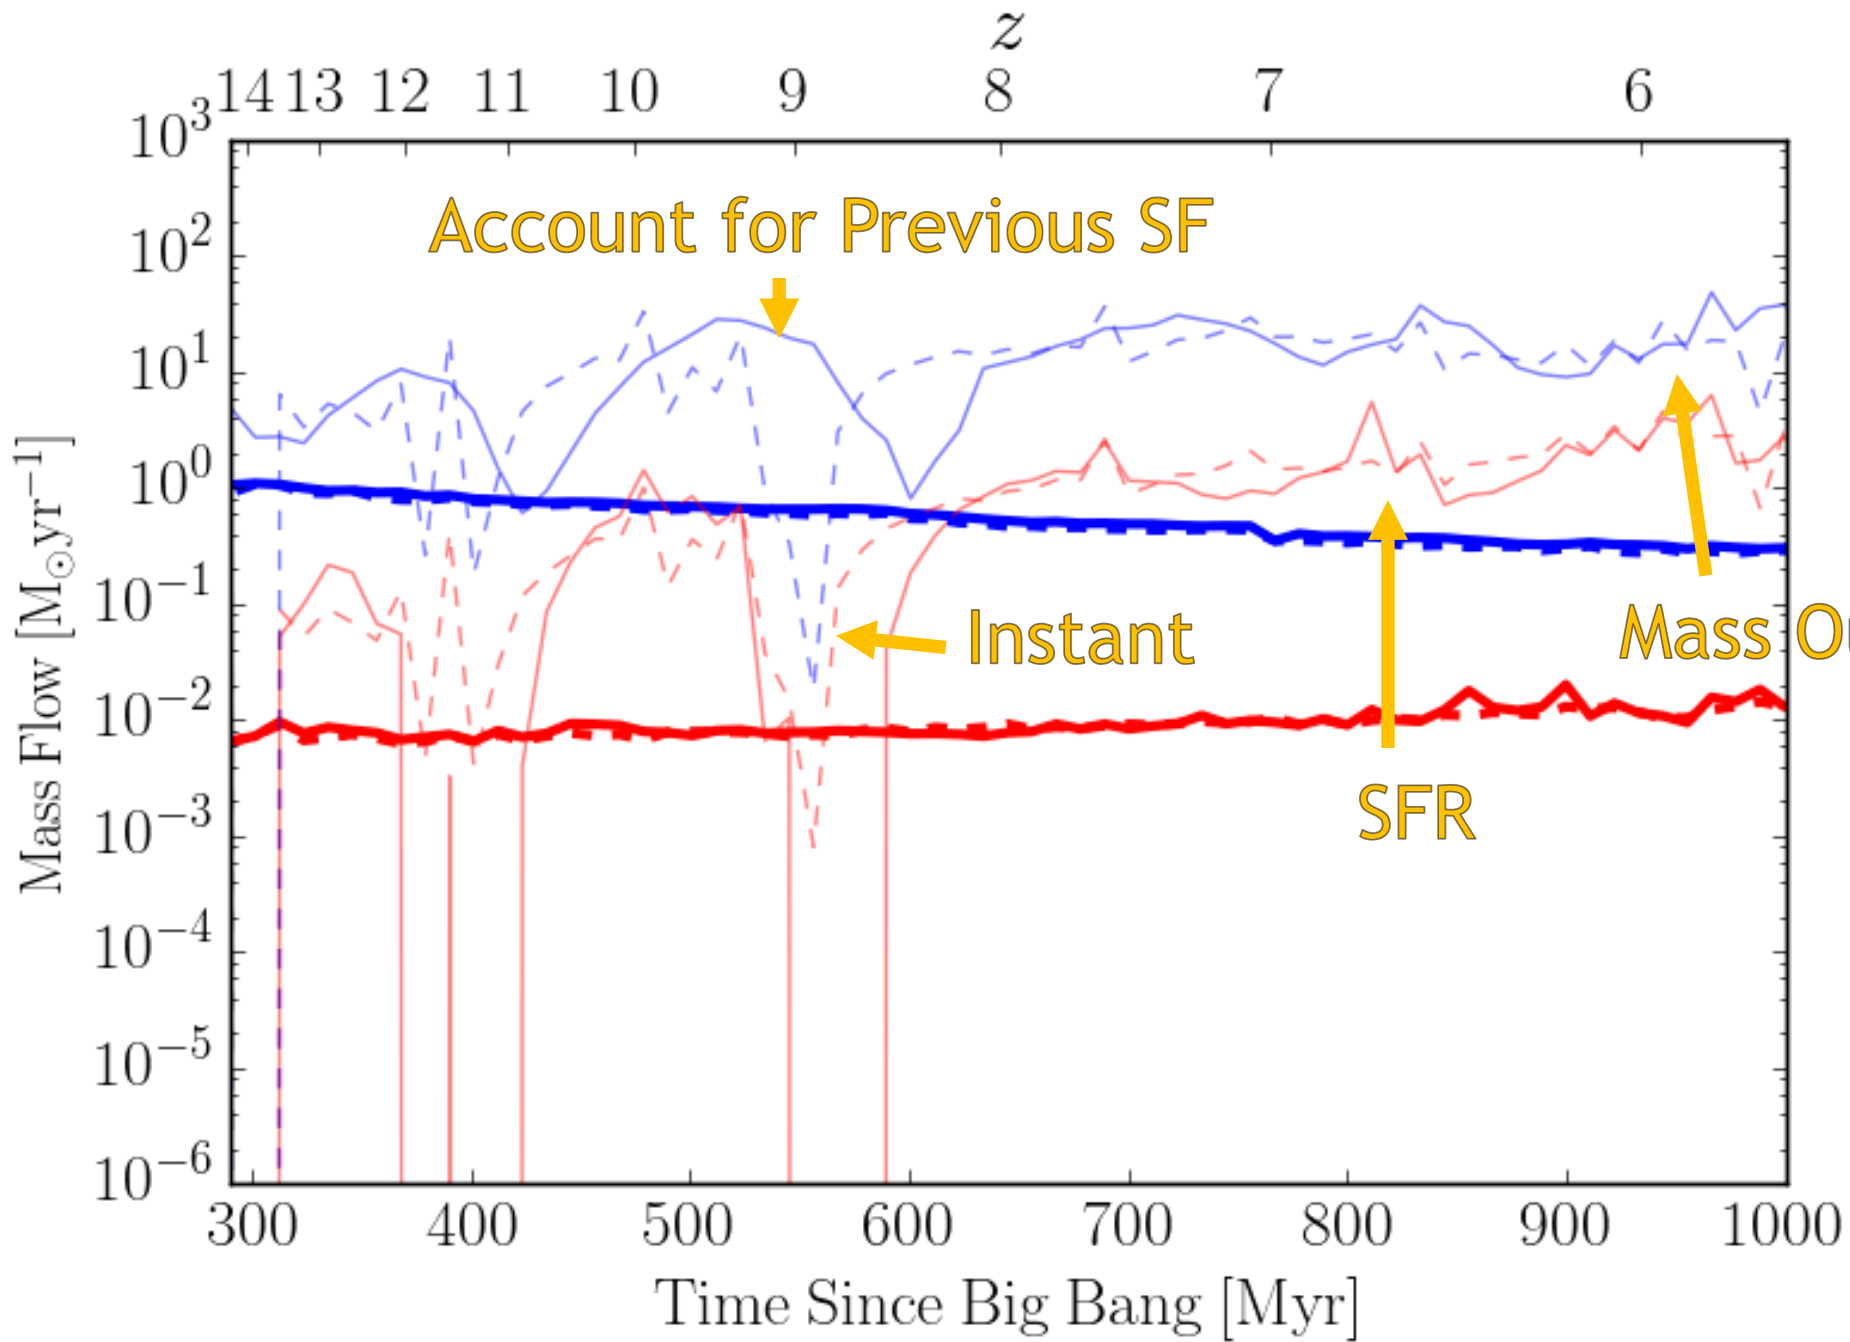

Cold gas collapses : Move gas from cold to stars.

Stars explode : Cold gas reheated + hot gas ejected.

Etc...etc...etc...

- Modular. Perfect for testing specific galaxy evolution prescriptions.
- Fast (compared to hydro). Perfect for finding rare events within large volumes.

Question to the floor: What can semi-analytic models do for you?

ending

# Escape Fraction Parameterization

$$f_{\text{esc}} = \text{Constant}$$

$$f_{\text{esc}} \propto M_{\text{H}}^{\beta}$$

$$f_{\text{esc}} \propto f_{\text{Ejected}}$$

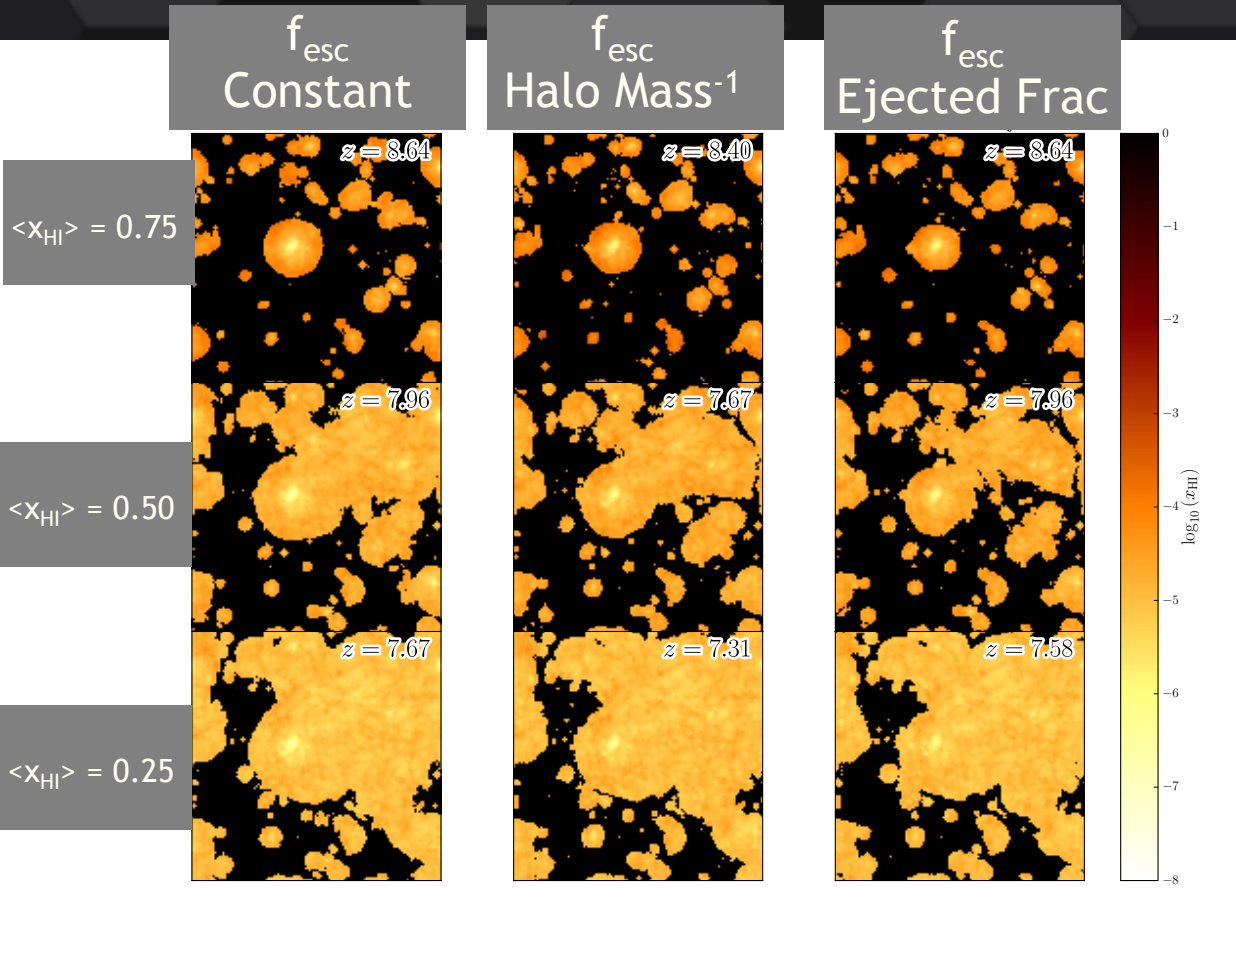

# Escape Fraction Parameterization

$$f_{\text{esc}} = \text{Constant}$$

Question to the floor: What galaxy properties/processes impact  $f_{\text{esc}}$  the most?

$$f_{\text{esc}} \propto f_{\text{Ejected}}$$

# Modelling Reionization

# Summary

- $f_{\text{esc}}$  is a complex combination of parameters depending upon galaxy properties.
- Semi-Analytic Models offer the ability to compare different galaxy evolution prescriptions with cheap computational time.
  - What can they do for you?
- Linking  $f_{\text{esc}}$  to galaxy properties can have a noticeable effect on reionization topology. How does this couple into galaxy evolution?
