

Peering towards Cosmic Dawn

IAU Symposium 333

Dubrovnik

04/10/2017

Average radio spectral energy distribution of highly star forming galaxies

Krešimir Tisanić, Vernesa Smolčić, Mladen Novak, Huib Intema et al.

Department of Physics

Faculty of Science

University of Zagreb

Croatia

Motivation

- Better SEDs
- Better K - corrections
- Better understanding of IRRC (a.k.a. q)
- Radio luminosity as an SFR tracer

Delhaize+ 2017

Radio spectral indices - Previous studies

Condon+ 1992

Niklas+ 1997

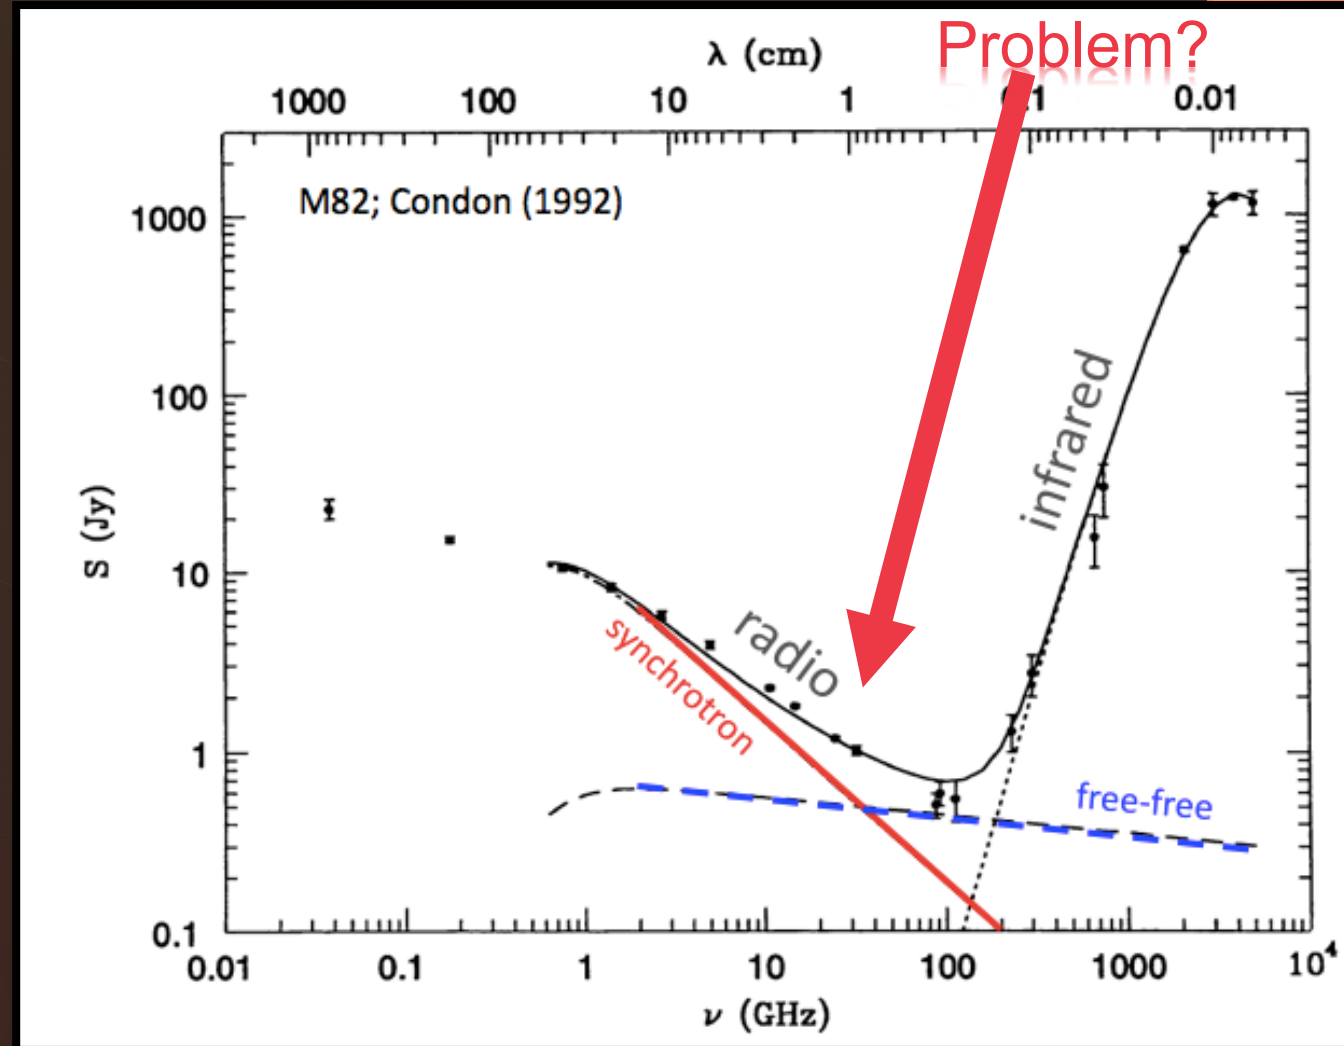

- Non-thermal
- Sa
 - $\alpha=0.74$
- Sb
 - $\alpha=0.85$
- Irr
 - $\alpha=0.74$

Clemens+ 2008

- $\nu < 4.8$ GHz
 - $\alpha=0.5$
- $\nu < 8.4$ GHz
 - $\alpha=0.7$
- $\nu > 8.4$ GHz
 - $\alpha=0.8$

Leroy+ 2011

- C - band
 - $\alpha=0.67$

- Introducing COSMOS

- Sample

- GMRT data

Data And the Sample

 - IRRC

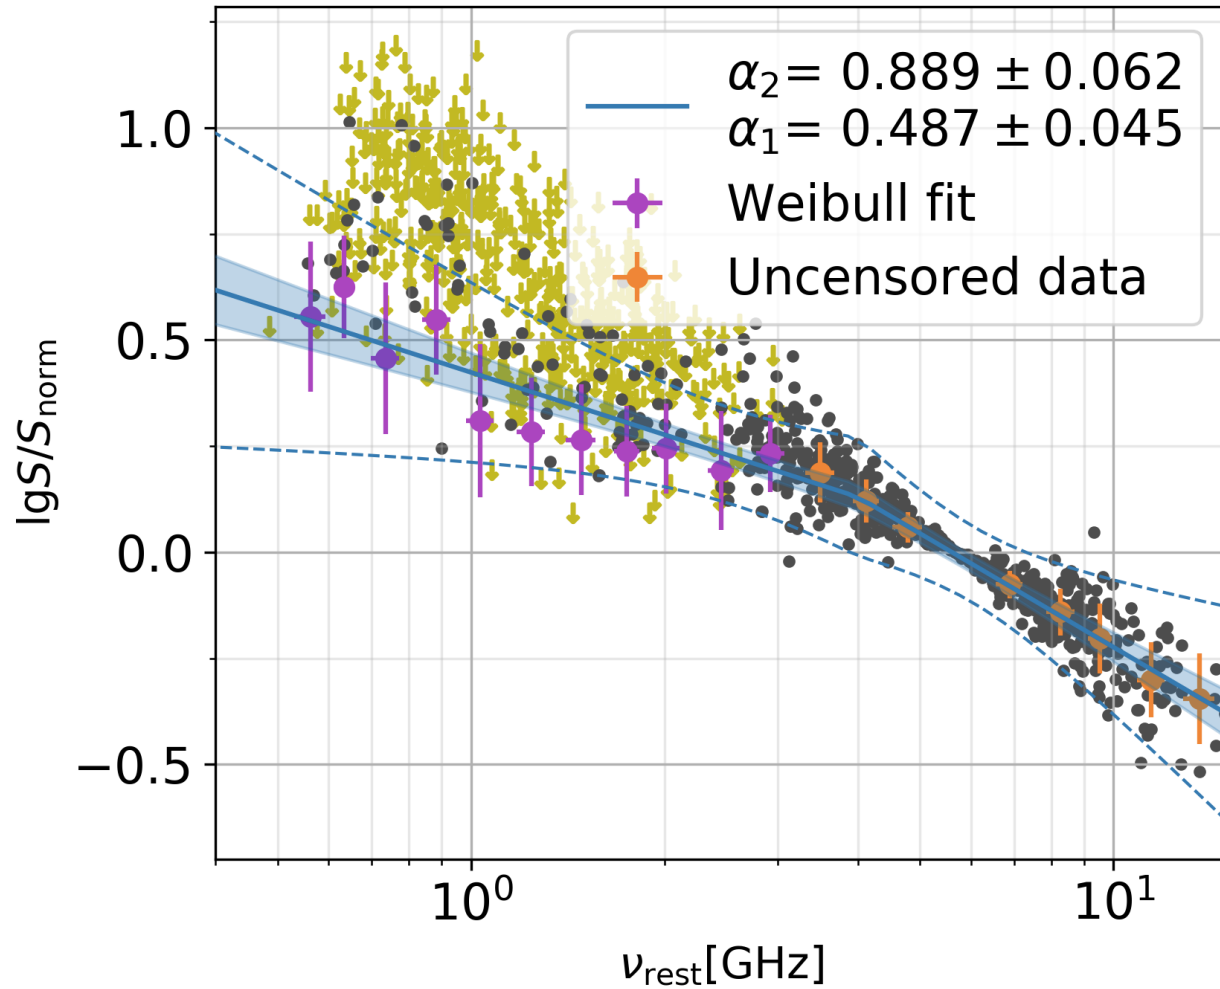

Results And Simulations

Dealing with upper limits

- Equally spaced log-rest-frame frequency bins
 - Upper limit = 5 x local RMS
- Made a Kaplan-Meier estimate
 - for each bin
- Fitted a Weibull distribution
 - to the Survival function
 - mean and standard deviation
- Fitting the with an SED

Broken power law fit & Stability

Tests – Monte Carlo Simulations

A

- α above 4 GHz

A

- Normalization

A

- Redshift

R

- Normal distribution

R

- Number of upper limits

R

- Varying α below 4 GHz

R

- Outliers with a fixed $\alpha=0.2$

Tests – Monte Carlo Simulations

A

- α above 4 GHz

A

- Normalization

A

- Redshift

R

- Normal distribution

R

- Number of upper limits

R

- Varying α below 4 GHz

R

- Outliers with a fixed $\alpha=0.2$

Tests – Monte Carlo Simulations

A

- α above 4 GHz

A

- Normalization

A

- Redshift

R

- Normal distribution

R

- Number of upper limits

R

- Varying α below 4 GHz

R

- Outliers with a fixed $\alpha=0.2$

Mean ratio

Sensitivity to Outliers

H

- H_0 : derived α = simulated α
- H_1 : they are different

Combining

- Derived α vs. simulation-derived σ
- Percentage of upper limits
- median normalized log-Flux of upper limits /detections

?

- Excluding portions of the parameter space up to a chosen p-value?

?

- Which part of it is “unresolved”?

K-corrections for broken-power laws

Summary and Outlook

Data

- Used a combined VLA 1.4 & 3 GHz sample
- Shallower GMRT 325 & 610 MHz data

Sample

- Highly star forming galaxies in the COSMOS field

SED

- Constructed an SED in the radio - broken power law
- Steeper spectrum above 4 GHz (0.9), and a flatter spectrum below 4 GHz (0.5)
 - in line with Clemens and Leroy (0.5-0.8, ULIRGs)

Outliers

- Described the influence of flat-spectrum outliers to the dataset

q

- Can we construct IRRC for highly star forming galaxies with the best-fit SED?
